

Structure of the COREP taxonomies

COREP project team

Magdalena Llano (ESP)

Daniel Hamm (GER)

Agenda

COREP business model

- **How is it structured?**
- **What are its main characteristics?**
- **How are these characteristics mapped to XBRL?**

Part I

COREP business model

- **How is it structured?**
- **What are its main characteristics?**
- **How are these characteristics mapped to XBRL?**

Structure of the COREP business model

- **COREP business model for solvency reporting consists of 18 templates today. From business point of view they are grouped in:**
 - **Credit Risk**
 - **Group Solvency Details**
 - **Market Risk**
 - **Operational Risk**
- **These 18 templates are mapped to the XBRL format.**
- **XBRL mapping of the COREP business model is henceforth called the **COREP taxonomies.****
- **So, before understanding the structure of the taxonomies, understanding of the business model is important.**

What is a COREP template?

- **A template is a form to collect certain data as part of the solvency reporting.**
- **Example: MKR SA EQU**
 - **MKR is Market Risk**
 - **SA is Standardised Approach**
 - **EQU is Equity**

COREP template in detail

A measure element is a fact for which a value can be reported

Measure

- All Positions
 - Long
 - Short
- Reduction Effect For Underwriting...
- Net Positions
- ...

- elements are labelled
- elements are structured
- elements can be calculated

Open List

Dimension III (National Market)
(Non explicit members)

A dimension element characterises a reported fact

Dimension I (Equities In Trading Book)

- Equities In Trading Book
 1. General Risk
 2. Specific Risk
 3. ...

Dimension II (Equity Exposures)

- 1.1 Zone 1
- 1.2 Zone 2
- ...

MKR SA EQU	MARKET RISK: STANDARDISED APPROACH FOR POSITION RISK IN EQUITIES							RISK CAPITAL CHARGE (%)	CAPITAL REQUIREMENTS
	POSITIONS								
	ALL POSITIONS		REDUCTION EFFECT FOR UNDERWRITING POSITIONS	NET POSITIONS		NET POSITIONS SUBJECT TO CAPITAL CHARGE			
	LONG	SHORT		LONG	SHORT				
	(1)	(2)	(3)	(4)	(5)	(6)		(7)	
National market:									
EQUITIES IN TRADING BOOK									
1 General risk							8.00	Link to CA template	
1.1 Exchange traded stock-index									
1.2 Other equities than									
2 Specific risk							2.00		
2.1 High quality, liquid and divers							4.00		
2.2 Other equities than high qua									
3 Particular approach for position									
4 Margin-based approach for exch									
5 Margin-based approach for OTC									
6 Other non-delta risks for options									

Página 1

What is a COREP template?

A template combines one **measure with an arbitrary number of **dimensions** and defines which combinations are allowed and which are invalid.**

How is this done?

Allowed and invalid combinations

Allowed combination:

All Positions - Long (measure) and

2. Specific Risk (dimension)

=> white cell

MKR SA EQU		MARKET RISK: STANDARDISED APPROACH FOR POSITION RISK IN EQUITY					
National market:							
		POSITIONS					
		ALL POSITIONS		REDUCTION EFFECT FOR UNDERWRITING POSITIONS	NET POSITIONS		NET POSITIONS SUBJECT TO CAPITAL CHARGE
		LONG (1)	SHORT (2)	(3)	LONG (4)	SHORT (5)	(6)
EQUITIES IN TRADING BOOK							
1 General risk							
1.1 Exchange traded stock-index futures broadly diversified subject to particular approach							
1.2 Other equities than exchange traded stock-index futures broadly diversified							
2 Specific risk							
2.1 High quality, liquid and diversified portfolios subject to lower capital requirements							
2.2 Other equities than high quality, liquid and diversified portfolios							
3 Particular approach for position risk in CIUs							
4 Margin-based approach for exchange-traded futures and options							
5 Margin-based approach for OTC futures and options							
6 Other non-delta risks for options							

Invalid combination:

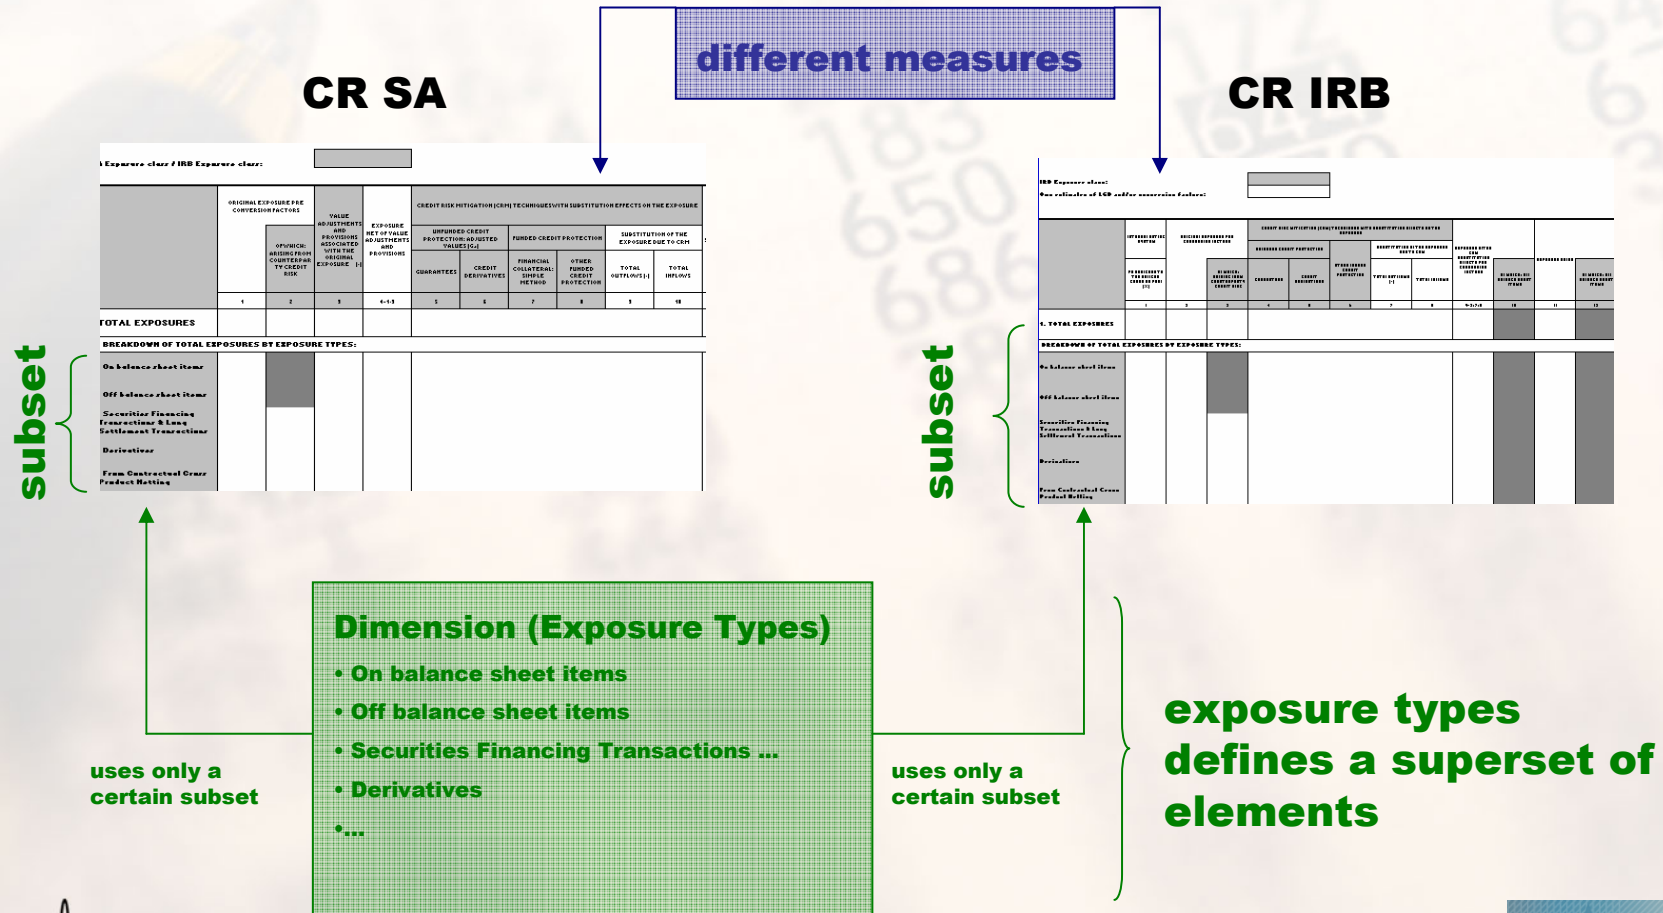

Net Positions - Short (measure) and

6 Other non-delta risks for options (dimension)

=> grey cell

Reuse of dimensions

Important characteristic: **Dimensions** are reusable across different templates

Structure of the COREP business model

- **The business model is split into measures and dimensions.**
- **A template combines measures and dimensions and defines allowed and invalid combinations.**
- **Invalid combinations include:**
 - **A combination of one measure element and one dimension element (shown as „grey cell“).**

The Data Matrix

- The Data Matrix defines the relation between templates and dimensions.
- It clarifies the reuse of dimensions.
- It tells which dimension is used in which template, but not which elements of this dimension.

dimensions

Templates				Dimensions						
No.	Template name	Template prefix	Primary dimension prefix	SA Exposure Class	IRB Exposure Class	Exposure	Exposure type	Risk Weight	Own estimates of LGD / Conversion factors	
				d-sc	d-ic	d-ex	d-et	d-rw	d-oe	
1	CA	t-ca	p-ca	0						
2	GROUP Solvency Details	t-gd	p-gd	0						
3	CR SA	t-cs	p-cs	5	x	x	x	x		
4	CR IRB	t-ci	p-ci	6		x	x	x	x	
5	CR EQU IRB	t-ce	p-ce	3				x		
6	CR SEC SA	t-ss	p-ss	4			x

templates

Part II

COREP business model

- How is it structured?
- What are its main characteristics?
- How are these characteristics mapped to **XBRL?**

What are the COREP taxonomies?

- **COREP taxonomies are the XBRL-format of the COREP business model.**
- **Different „languages“ to express this model:**
 - **Describe it on paper.**
 - **Describe it in Excel spreadsheets.**
 - **Describe it in XBRL!**
- **Most difficult task: Keep the model **complete, correct and consistent** in each „language“.**
- **That means: Maintaining the COREP characteristics cross each language.**
- **Let’s summarise the main characteristics.**

Main characteristics of the COREP model

- **Primary and dimension elements do have a certain structure.**
 - **Parent-child relations, calculations.**
- **Measures and dimensions are combined into templates.**
- **Dimensions are reused in more than one template, but with different elements.**
- **Allowed and invalid combinations of dimensions are defined in each template.**
- **The model is flexible and extensible.**

Main characteristics of the COREP model

- **Primary and dimension elements do have a certain structure.**
 - **Parent-child relations, calculations.**
- Measures and dimensions are combined into templates.
- Dimensions are reused in more than one template, but with different elements.
- Allowed and invalid combinations of dimensions are defined in each template.
- The model is flexible and extensible.

Keep the structure of measures and dimensions

- Three types of taxonomies: Primary, dimensional and template taxonomies
- Each measure gets its own primary taxonomy:

- Each dimension gets its own taxonomy:

Keep the structure of measures and dimensions

What do we get?

•labelling?

☺ Yes, XBRL can do it

•defining parent-child relations?

☺ Yes, XBRL can do it

INTERNAL RATING SYSTEM	ORIGINAL EXPOSURE PRE CONVERSION FACTORS	CREDIT RISK MITIGATION (CRM) 1		
		UNFUNDED CREDIT PROTECTION		
PD ASSIGNED TO THE OBLIGOR GRADE OR POOL (%)	OF WHICH: ARISING FROM COUNTERPARTY CREDIT RISK	GUARANTEES	CREDIT DERIVATIVES	

•defining calculations?

☺ Yes, XBRL can do it

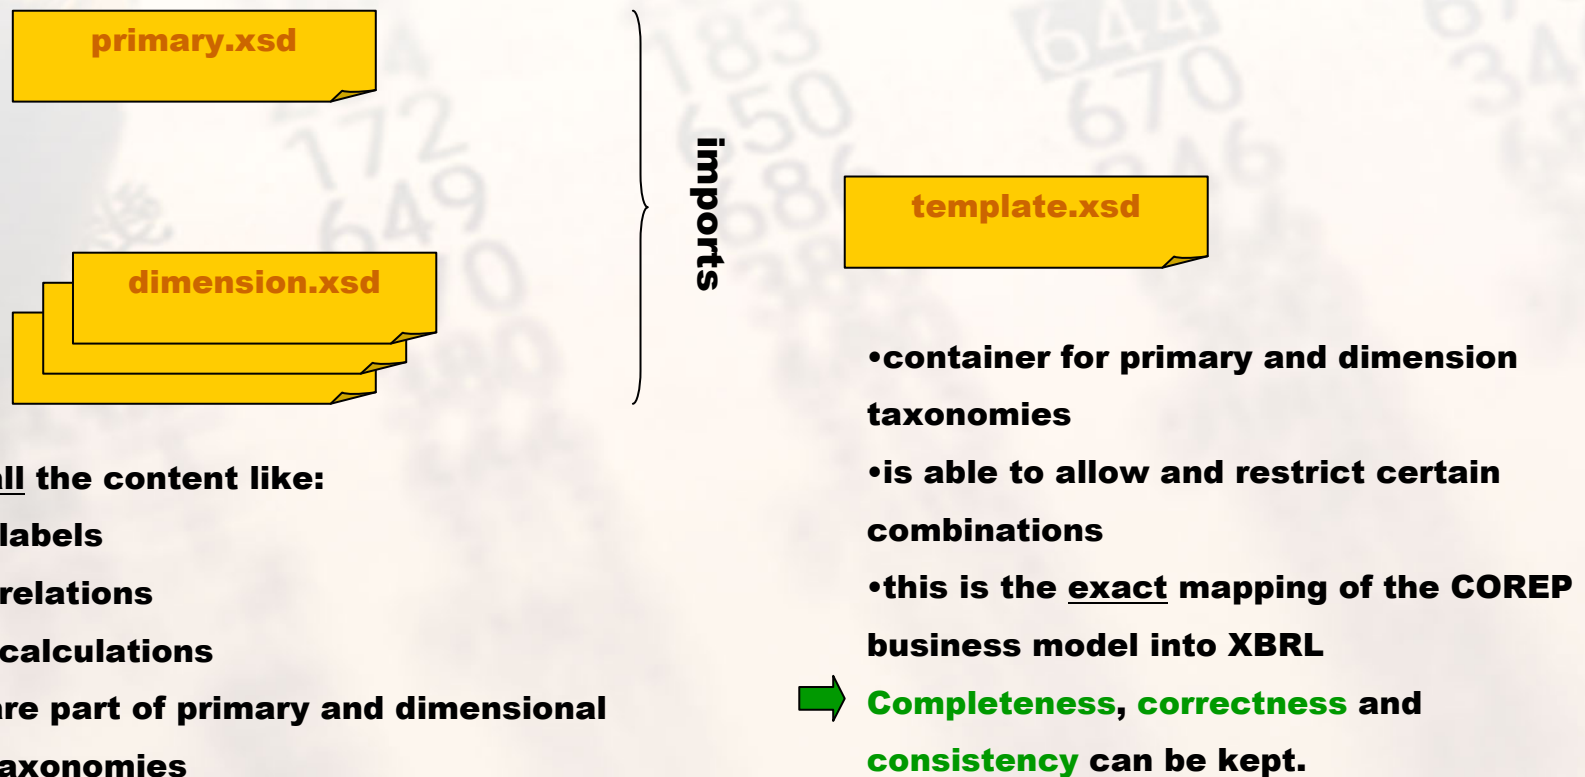

Main characteristics of the COREP model

- **Primary and dimension elements do have a certain structure.**
 - **Parent-child relations, calculations.**
- **Measures and dimensions are combined into templates.**
- **Dimensions are reused in more than one template, but with different elements.**
- **Allowed and invalid combinations of dimensions are defined in each template.**
- **The model is flexible and extensible.**

Template taxonomy

- The third kind of taxonomy is a template taxonomy.
- „Business language“: A template is a combination of a measure and dimensions.
- „XBRL language“: A template taxonomy imports a primary and dimensional taxonomies.

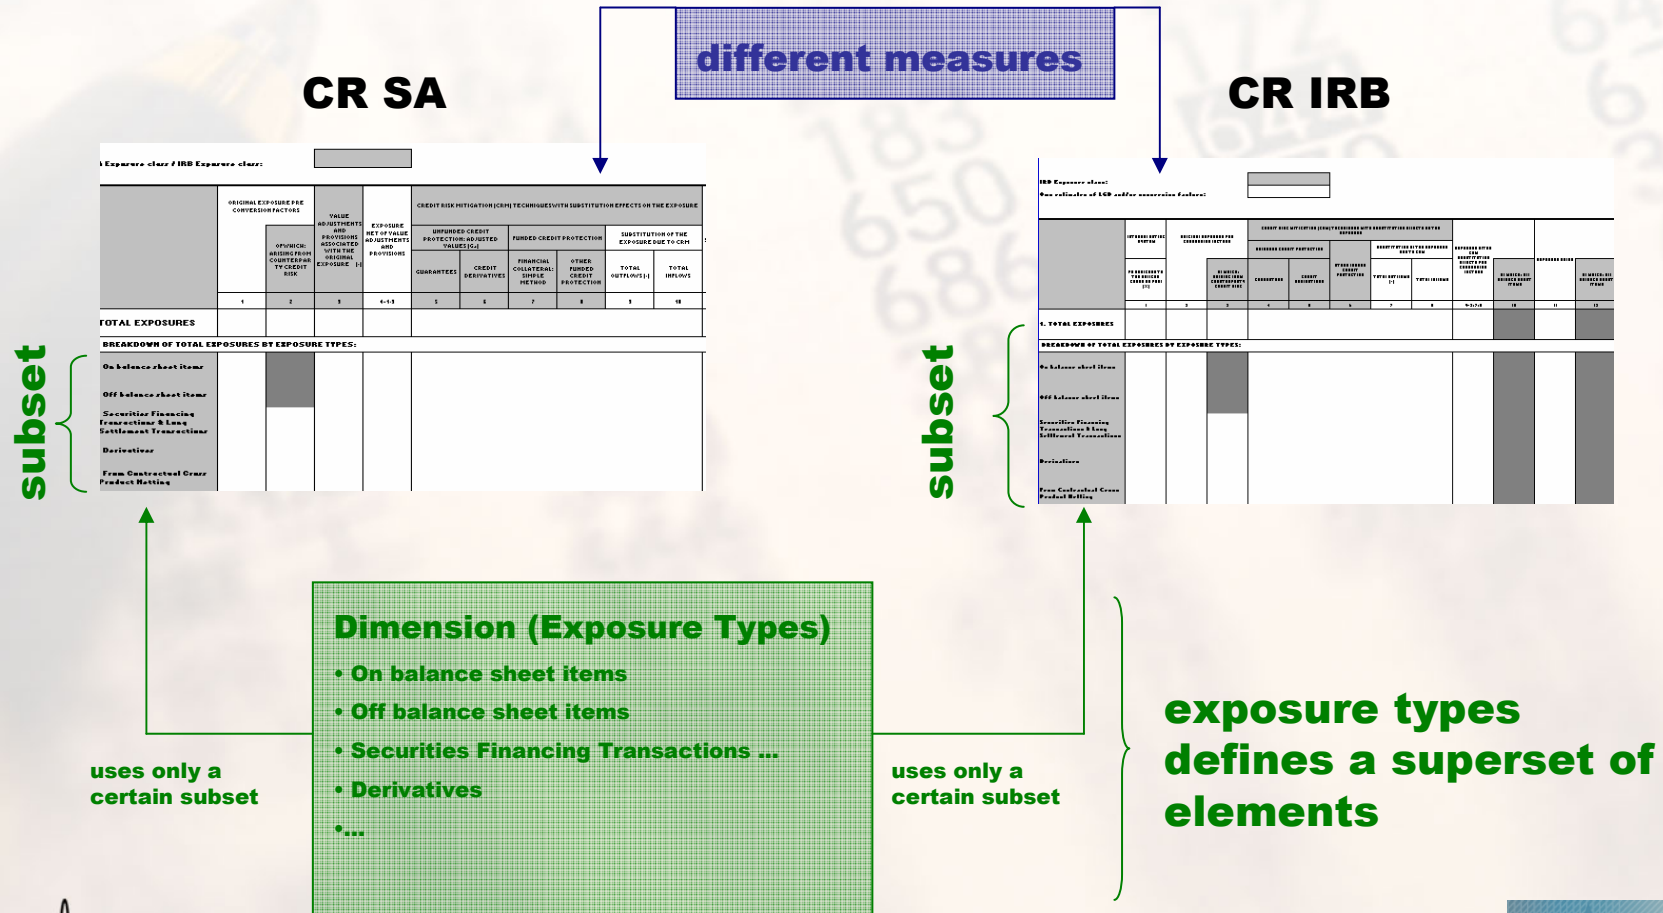

Main characteristics of the COREP model

- **Primary and dimension elements do have a certain structure.**
 - **Parent-child relations, calculations.**
- **Measures and dimensions are combined into templates.**
- **Dimensions are reused in more than one template, but with different elements.**
- **Allowed and invalid combinations of dimensions are defined in each template.**
- **The model is flexible and extensible.**

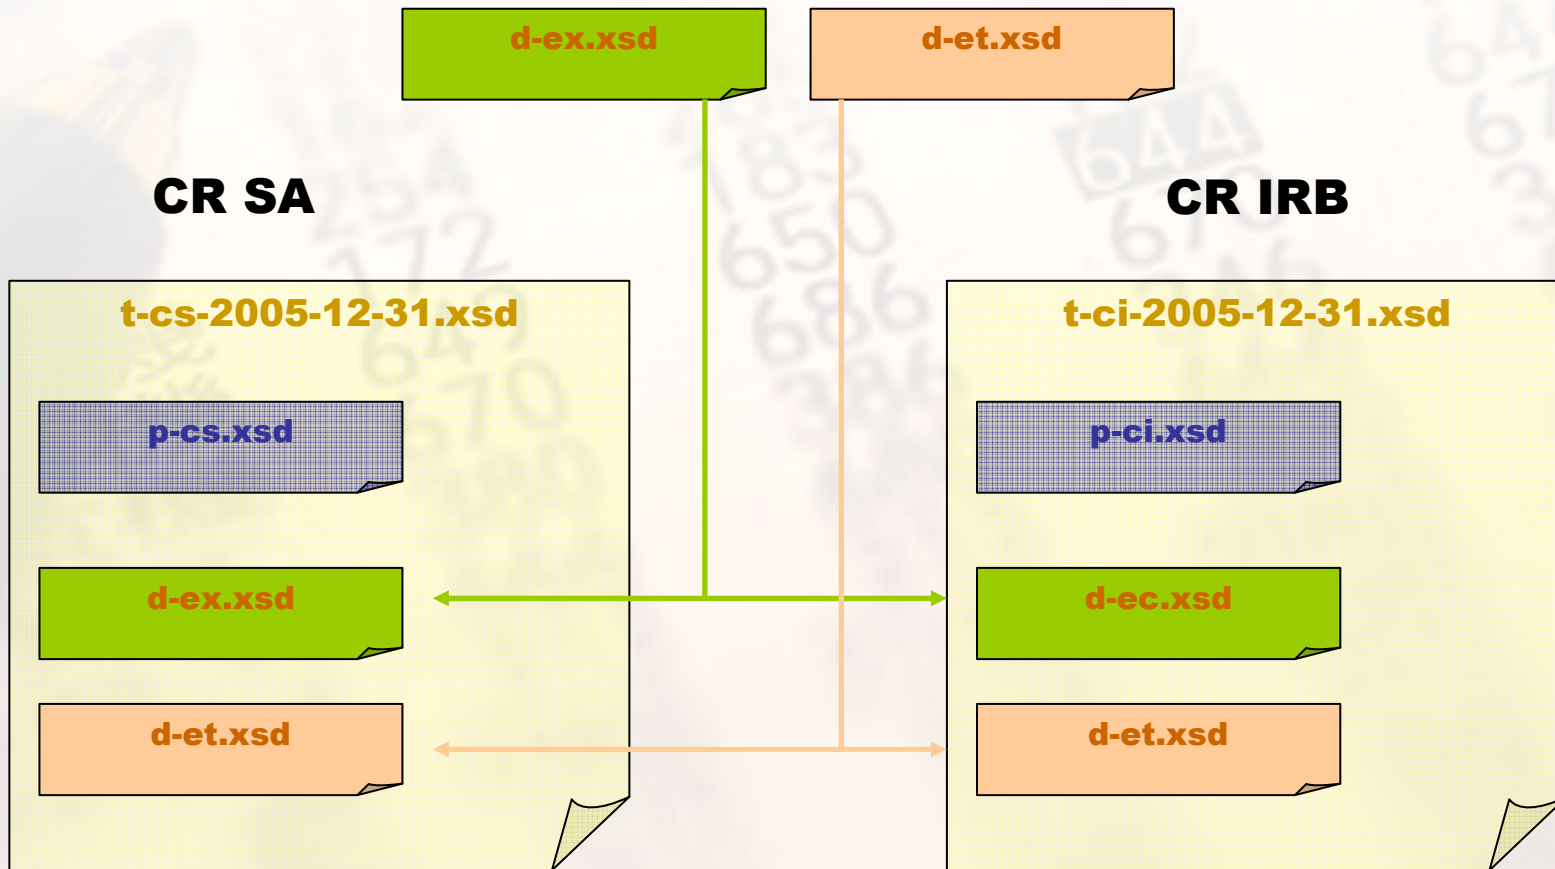

Reuse of dimensions

Important characteristic: **Dimensions** are reusable across different templates

Reuse of dimensions

- So, how to reuse dimensions in XBRL?

Main characteristics of the COREP model

- **Primary and dimension elements do have a certain structure.**
 - **Parent-child relations, calculations.**
- **Measures and dimensions are combined into templates.**
- **Dimensions are reused in more than one template, but with different elements.**
- **Allowed and invalid combinations of dimensions are defined in each template.**
- **The model is flexible and extensible.**

Allowed and invalid combinations

Allowed combination:

All Positions - Long (measure) and

2. Specific Risk (dimension)

=> white cell

MKR SA EQU		MARKET RISK: STANDARDISED APPROACH FOR POSITION RISK IN EQUITY					
National market:							
		POSITIONS					
		ALL POSITIONS		REDUCTION EFFECT FOR UNDERWRITING POSITIONS	NET POSITIONS		NET POSITIONS SUBJECT TO CAPITAL CHARGE
		LONG (1)	SHORT (2)	(3)	LONG (4)	SHORT (5)	(6)
EQUITIES IN TRADING BOOK							
1 General risk							
1.1 Exchange traded stock-index futures broadly diversified subject to particular approach							
1.2 Other equities than exchange traded stock-index futures broadly diversified							
2 Specific risk							
2.1 High quality, liquid and diversified portfolios subject to lower capital requirements							
2.2 Other equities than high quality, liquid and diversified portfolios							
3 Particular approach for position risk in CIUs							
4 Margin-based approach for exchange-traded futures and options							
5 Margin-based approach for OTC futures and options							
6 Other non-delta risks for options							

Invalid combination:

Net Positions - Short (measure) and

6 Other non-delta risks for options (dimension)

=> grey cell

How to allow and restrict combinations

•The template taxonomy offers the possibility to express invalid combinations in „XBRL language“

MKR SA EQU		MARKET RISK: STANDARDISED APPROACH FOR POSITION RISK IN EQUITIES					
National market:							
		POSITIONS					
		ALL POSITIONS		REDUCTION EFFECT FOR UNDERWRITING POSITIONS	NET POSITIONS		NET POSITIONS SUBJECT TO CAPITAL CHARGE
		LONG (1)	SHORT (2)	(3)	LONG (4)	SHORT (5)	(6)
EQUITIES IN TRADING BOOK							
1 General risk							
1.1 Exchange traded stock-index futures broadly diversified subject to particular approach							
1.2 Other equities than exchange traded stock-index futures broadly diversified							
2 Specific risk							
2.1 High quality, liquid and diversified portfolios subject to lower capital requirements							
2.2 Other equities than high quality, liquid and diversified portfolios							
3 Particular approach for position risk in CDOs							
4 Margin-based approach for exchange-traded futures and options							
5 Margin-based approach for OTC futures and options							
6 Other non-delta risks for options

•d-ri_OtherNonDeltaRisksOptions

National Market Dim.

Invalid combination

The relationship „is not allowed“ can be expressed and validated

Main characteristics of the COREP model

- **Primary and dimension elements do have a certain structure.**
 - **Parent-child relations, calculations.**

Fulfilled.

- **Measures and dimensions are combined into templates.**

Fulfilled.

- **Dimensions are reused in more than one template, but with different elements.**

Fulfilled.

- **Allowed and invalid combinations of dimensions are defined in each template.**

Fulfilled.

- **The model is flexible and extensible.**

To be explained ...

Thank you!

Thank you for your attention
